

Downeast LNG Information Brief

Why Do We Need Natural Gas?

Natural gas currently provides up to 60% of all electricity produced in Maine, and nearby natural gas reserves from Sable Island are dwindling. New England has invested in natural gas power generation over the last five years to improve air quality in the region and reduce carbon dioxide (CO₂) emissions relative to oil or coal generation. Without new supplies, New England will face a serious energy shortfall within the next decade.

Downeast LNG is committed to bringing LNG supplies to Maine and New England and will continue working with our neighbors to build a project that brings long term benefits to the community.
